

Data Driven Testing Working With MS Excel

10 August 2024 22:47

Apache POI is a Java API used to work with Excel Files.

```
<!-- https://mvnrepository.com/artifact/org.apache.poi/poi -->
<dependency>
<groupId>org.apache.poi</groupId>
<artifactId>poi</artifactId>
<version>5.3.0</version>
</dependency>
```

```
<!-- https://mvnrepository.com/artifact/org.apache.poi/poi-ooxml -->
<dependency>
<groupId>org.apache.poi</groupId>
<artifactId>poi-ooxml</artifactId>
<version>5.3.0</version>
</dependency>
```

Excel File ---->Workbook ---->Sheets --->Rows ---->Cells
Reading and Writing

FileInputStream -reading
FileOutputStream -Writing

These two are not from Apache POI

Above two are Java classes for opening the file into reading mode and writing mode
These classes are applicable to all the Microsoft files like excel word notepad

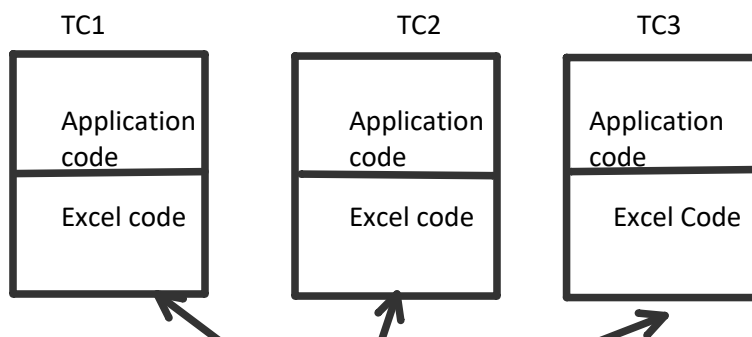

XSSFWorkbook ---- workbook
XSSFSheet ---- Sheet
XSSFROW ---- ROW
XSSFCell ---- cell

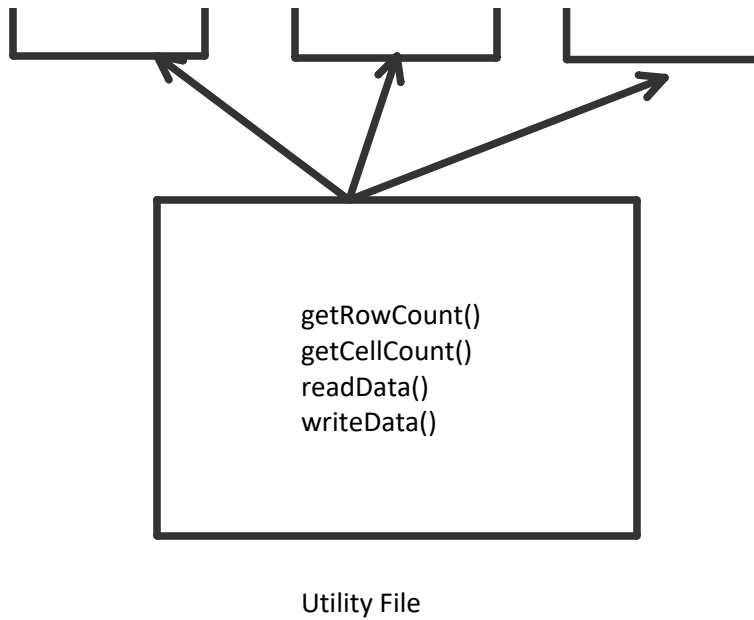

All the above files are from Apache POI

Data Driven Testing

First we will prepare test data in excel sheets and read the data from we use the same data for testing purpose means we can pass same data to the application and do some validation and then some times we will write back results into excel sheets.

For all data driven testing we have few common steps like reading the data from excel writing data from excel

Before using utility file

Complexity of code increases
Duplication of code is more

After using utility

Complexity got reduced
Duplication of code also reduced
Reusability we achieved.

Right click on cell and check the format of a cell

Properties file

Which ever data is commonly required for multiple test cases we will keep that data in properties file.

Like site url

Username

Password

All these values will be stored in the form of key value pairs without hving quotation for values
