

Java Script Executor/ Scrolling pages /Uploading files

05 August 2024 10:59

Selenium WebDriver consists of many predefined classes and Interfaces.

Java Script Executor is an interface which is implemented by RemoteWebDriver class.

Remote WebDriver is a class which which is implemented few methods in java script executor as well as Take Screenshot.

What is the use of java script executor ? where exactly we use it.

Java Script is an interface which is having executeScript() method by which we can execute javascript statements.

Javascript - scripting language which we can use for web development.
Java .

Java -is programming language through which we can write business logic

Why we need to execute java script statements in our WebDriver script?

When we call any driver methods like click() method it internally executes some java script statements because of which we can able to interact with Web Elements like radio button dropdown etc.,

When we call click()method some times it is not able execute inside java script statements and it throws **"element intercepted exception"**

The remedy for this is instead of calling click() method for executing java script statements we can directly execute these java script statements in our code through executeScript() method in webDriver script.

We will pass javascript statements inside executeScript() method.

We are going to use this JavaScript executor method instead of (WebElement) action methods like click(), sendKeys()

element intercepted exception we will get this only on radio button , check boxes and input boxes.

```
WebDriver driver=new ChromeDriver();
JavaScriptExecutor js=(JavaScriptExecutor)driver;
```

Here actually WebDriver and JavaScriptExecutor are two different interfaces they don't have direct relation ship thats why we are upcasting it

```
ChromeDriver driver=new ChromeDriver();
//JavaScriptExecutor js=driver;
```

Here chromeDriver class is child class of java script executor class and we can directly assign to the java script interface we no need of to do casting.

```
//When we get element intercepted Exception then only we will use this
as workaround or alternative for send keys method as well click() method.
WebElement inputBox=driver.findElement(By.xpath("//input[@id='name']"));

//passing the text into inputbox -alternate of sendKeys()
JavaScriptExecutor js=(JavaScriptExecutor)driver;
js.executeScript("arguments[0].setAttribute('value','john')",inputBox);

//clicking on element - alternate of click();
WebElement radiobtn=driver.findElement(By.xpath("//input[@id='male']"));
js.executeScript("arguments[0].click()", radiobtn);
```

Scrolling Page.

Its not a web Element

Its not developed any developer.

Based on the size of webpage created the browser will display the scroll bar.

This we ca do with the help of Java Script Executor

ZOOM IN ZOOM OUT Also we can do with the help of JavaScript Executor

```
WebDriver driver=new ChromeDriver();
driver.get("https://demo.nopcommerce.com/");
Thread.sleep(5000);
driver.manage().window().minimize();
Thread.sleep(5000);
driver.manage().window().maximize();
Thread.sleep(5000);
```

```
JavascriptExecutor js=(JavascriptExecutor)driver;  
js.executeScript("document.body.style.zoom='50%'"); //set zoom level 50%  
Thread.sleep(5000);  
  
js.executeScript("document.body.style.zoom='80%'"); //set zoom level 80%  
Thread.sleep(5000);
```

File Upload:

sendKeys()
