

TestNG Annotations & Types of Assertions

16 August 2024 20:39

Annotations:

@Test

@BeforeMethod

@AfterMethod

@BeforeClass

@AfterClass

@BeforeTest

@AfterTest

@BeforeSuite

@AfterSuite

Tc1

1)Login -----> @BeforeMethod

2)Search -----> @Test

3)Logout -----> @AfterMethod

4)Login ----->

5)Adv Search ---> @Test

6)Logout ----->

Validations can be done through test methods only tats why we only see passed or failed messages for test methods.

Tc2

1)Login -----> @BeforeClass

2)Search -----> @Test

3)Adv Search --> @Test

4)Logout ----->@AfterClass

Xml

```
<suite name="mysuite">
  <test name="mytest1">
    <classes>
      <class name="xyz"/>
    </classes>
  </test>

  <test name="mytest2">
    <classes>
```

```
        <class name="abc"/>
    </classes>
</test>

</suite>
```

- 1) Annotations will help us to control order of execution.

Assertions

--> a validation point

Why we need assertions?

Actual and predicted

Even though our conditions failed but our test method is passed to overcome this we use assertions

Testng will take the result of test method not conditional statements.

Test method results will be updated in results and reports

Assertions :

- 1) Hard assertions

- 2) Soft Assertions

Most of the times we use hard assertions

All the assertions we put in test method only not in any other test

Hard assertions we can directly access from Assert class

All these methods are static

Hard vs soft assertion

In case of Hard Assertion

all the statements before assertion statement will execute. In case if assertion failed the statement after the assert statement will not execute

Always remember the assert statement should be last statement in method.

To overcome this we go for soft assertion.

Hard assertions:

We can access from "Assert" class

Methods are static

If hard assertion failed then rest of the statements will not be executed.

Soft Assertion

We can access through "SoftAssert" Object

SoftAssert sa =new SoftAssert();

sa.assetTrue()

If soft assertion got failed then rest of the statements still execute.
