

Frames/Iframes

27 July 2024 20:37

Desktop Application

We will divide web Elements into different groups and those elements will be placed in separate section is called frames.

Web Applications

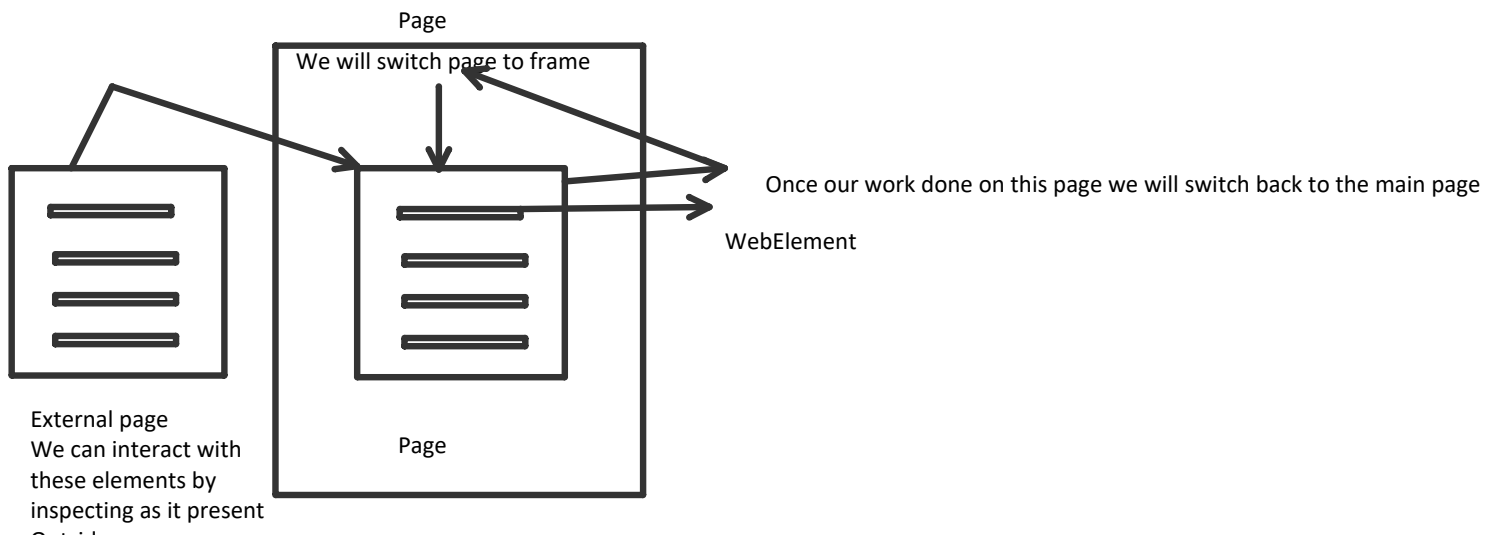

When a webpage is embedded into another webpage it is called iframe.

Similar to Frames the we will place multiple webpages in an external webpage.

Those were all called iframe or frame or form

Driver will always focus on page level

But incase of frames we cannot directly interact with the elements.

We can interact with these elements by inspecting as it present Outside

Page

```
driver.switchto().frame()
```

When we embedd this page into some other page as a form or frame in that case we can directly interact with this page.

We can pass id or name or webelement

For interacting with this form we have to switch the driver focus on to frame once our work done on frame we have again change driver focus to page.

```
driver.switchTo().frame(name)
```

```
driver.switchTo().frame(id)
```

```
driver.switchTo().frame(WebElement)
```

```
diver.switchTo().frame(index)
```

If we find single frame on the web pagethn only we will go for index

<https://ui.vision/demo/webtest/frames/>

```
driver.switchTo().deafultContent(); //go back to page
```

3 Types of Switching methods

1)browser windows

```
Driver.switchTo().window(windowID/WndowHandle)
```

2>alerts

```
Driver.SwitchTo().alert().accept()
```

```
Driver.SwitchTo().alert().dismiss()
```

3)Frames

```
Driver.switchTo().frame(id);
```

```
Driver.switchTo().frame(name);
```

```
Driver.switchTo().frame(WebElement);
```

Assignment

<https://ui.vision/demo/webtest/frames/>

1)Switch to 5th frame

2)Click on link -opens new iframe

3)switch to inner frame

4)Check logo presence in the inner frame.
